Build a Healthy Future

Pediatric cancers can be unpreventable because they often have unknown causes. Although the incidences increase each year, in the past decade mortality rates for pediatric cancers have declined. This is due to advancements in treatments, along with early and accurate diagnosis.¹

The Cell Marque™ antibody portfolio from MilliporeSigma offers an extensive selection of IVD immunohistochemical markers targeted towards pediatric neoplasms. These products range from traditional markers like TdT and myogenin, to novel markers such as PHOX2B, NKX2.2, and TFE3.
